# BUILD THE BATTLE Ddroid STEALTH TRANSPORT!

**PAGE 1**

The Battle Droid Stealth Transport Mark V, or BD-ST-5, is designed to quickly carry the Separatist Army's battle droid forces down through a planet's atmosphere to the surface far below. Due to the disposable nature of the mass-produced droid troopers that they carry, these lightweight vehicles are equipped with no shields, no life support systems, and no fuel for a return trip. All of the onboard power is devoted to the repulsorlift engines and a pair of heavy blaster cannons in case the droids encounter Republic gunships on the way down.

You can build the Battle Droid Stealth Transport using pieces from #8086 Droid Tri-Fighter™!
